

MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focusing on degenerative classifications based on the provided images:

MRI Lumbar Spine Report

Degenerative Classification:

Multilevel Degenerative Disc Disease: There is evidence of degenerative changes affecting multiple intervertebral discs, showing signal loss and varying degrees of dehydration. This is most prominent at the lower lumbar levels (L4-S1)

Facet Arthropathy: Degenerative changes are present at the facet joints with osteoarthritic features seen.

Ligamentum Flavum Thickening: Some thickening of the ligamentum flavum can be seen, primarily in the lower lumbar region.

Mild Spondylolisthesis There is evidence of mild spondylolisthesis at L4 on L5.

Note: This report solely focuses on degenerative classifications. Other findings related to pathology such as disc herniation, nerve compression, or other issues will need to be evaluated by a trained radiologist.
