

MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focusing solely on degenerative classifications, based on the provided images:

MRI Lumbar Spine Report - Degenerative Classification

Findings:

Multilevel Degenerative Disc Disease: There is evidence of degenerative changes involving multiple intervertebral discs, particularly in the lower lumbar region. These changes are manifested as disc desiccation, loss of disc height, and disc bulging.

Facet Arthropathy: Degenerative changes are noted in the facet joints at multiple levels, indicative of facet arthropathy (osteoarthritis of the spine).

Ligamentous Changes: Some thickening of the posterior longitudinal ligament may be present.

Spinal Canal and Neural Foraminal Stenosis: There is a moderate degree of spinal canal stenosis due to the aforementioned degenerative changes, especially at the L4-5 level. There is also evidence of neural foraminal narrowing.

Conclusion:

The imaging demonstrates moderate multilevel degenerative changes involving the intervertebral discs, facet joints, and ligaments. This has resulted in spinal canal and neural foraminal narrowing, particularly at the L4-5 level.

Note: *This report focuses solely on degenerative aspects. It is important to correlate clinical findings and other imaging or tests for a comprehensive understanding.*
