

MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focused only on degenerative classification, based on the provided images:

MRI Lumbar Spine Report - Degenerative Findings

Findings:

Intervertebral Discs:

Multilevel disc desiccation is observed, consistent with degenerative disc disease.

Moderate disc bulging is present at multiple levels.

There is a moderate central disc protrusion at the L4-L5 disc level.

Vertebral Bodies:

Multilevel Modic type 1 changes are present

Ligaments:

The posterior ligamentous complex appears intact

Ligamentum flavum thickening is present at multiple levels

Spinal Canal:

The overall spinal canal caliber is reduced at L4-L5 due to the disc protrusion and ligamentum flavum thickening

Impression:

Multilevel degenerative disc disease with disc desiccation, bulging, and a moderate central disc protrusion at L4-L5. Moderate multi-level facet arthropathy and ligamentum flavum thickening.
Multilevel Modic 1 changes

Note: This report only addresses degenerative findings. Additional findings might be

were not directly related to degenerative changes.
