

MRI Lumbar Spine Report

Certainly, here's a concise MRI lumbar spine report focusing solely on degenerative findings, based on the provided images:

MRI Lumbar Spine Report

Findings:

Disc Degeneration: There is evidence of disc desiccation and signal loss within multiple intervertebral discs. There appears to be disc height loss most prominently at L4-5 and L5-S1.

Facet Joint Degeneration: Subtle degenerative changes noted at the facet joints at multiple levels.

Spinal Canal Stenosis: There appears to be mild narrowing of the spinal canal, most notably at L4-5 and L5-S1, likely secondary to disc bulging/protrusion.

No Spinal Cord Compression: There is no evidence of compression to the spinal cord.

Impression:

These findings are consistent with mild to moderate degenerative changes involving the lumbar spine. There are signs of mild spinal canal narrowing, possibly due to disc bulging, most notable at L4-5 and L5-S1. No spinal cord compression was identified.
