

MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI findings indicate severe spinal canal stenosis at L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels bilaterally. There is moderate neural foraminal narrowing at L1-L2, L2-L3, L3-L4, and L4-L5 levels on both the left and right sides. The left subarticular stenosis is severe at L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels, while the right subarticular stenosis is moderate at L1-L2, severe at L2-L3, L3-L4, L4-L5, and moderate at L5-S1 levels.

In summary, the patient presents with severe bilateral spinal canal stenosis and moderate bilateral neural foraminal narrowing, with severe left subarticular stenosis and varying degrees of right subarticular stenosis. These findings may contribute to the patient's symptoms and may require further evaluation and management.

Recommendations:

1. Consultation with a spine specialist for further assessment and treatment planning.
2. Consideration of conservative management options, such as physical therapy, medications, and epidural steroid injections.
3. Evaluation for potential surgical intervention, such as decompression or fusion, depending on the severity of symptoms and response to conservative treatments.

Note: This report is intended for clinical use and should be reviewed by a qualified healthcare professional.
