

MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI lumbar spine demonstrates mild to moderate spinal canal stenosis and foraminal narrowing bilaterally between L1-L5 and S1. The stenosis and narrowing are most pronounced at the L5-S1 level on the right side, with severe narrowing noted.

Bilateral subarticular stenosis is also present, with mild to moderate changes observed between L1-L5 and S1. The right side shows normal/mild subarticular stenosis, while the left side exhibits moderate subarticular stenosis at the L5-S1 level.

Overall, the findings suggest mild to moderate degenerative changes in the lumbar spine, with more significant pathology on the right side, particularly at the L5-S1 level. Clinical correlation and further evaluation are recommended to guide management and treatment options.

Impression:

1. Mild to moderate bilateral spinal canal stenosis and foraminal narrowing, most severe at L5-S1 on the right side.
2. Mild to moderate bilateral subarticular stenosis, with moderate changes at L5-S1 on the left side.
3. Clinical correlation and further evaluation recommended for management and treatment planning.
