

# MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focused solely on degenerative classifications, based on the provided images:

## MRI Lumbar Spine Report (Degenerative Classification Only)

### Findings:

**Disc Degeneration:** Multilevel disc desiccation and loss of disc height is noted, primarily from L3/4 to L5/S1.

**Facet Arthropathy:** Mild facet arthropathy is present, most notably at L4-S1 with some mild hypertrophy.

**Spinal Stenosis:** Mild to moderate central canal stenosis is present at the L4/5 and L5/S1 levels, secondary to disc bulging and facet hypertrophy. Mild bilateral foraminal stenosis is present at these levels as well.

**Disc Bulging:** There is a moderate broad-based posterior disc bulge at L4/5 and L5/S1.

### Summary:

The MRI demonstrates multi-level degenerative changes of the lumbar spine, including disc desiccation, loss of disc height, disc bulging, facet arthropathy, and mild to moderate spinal and foraminal stenosis at L4-S1.

**Note:** This report focuses solely on degenerative findings. A complete interpretation include clinical correlation and other potential findings not included in this summary
