

# MRI Lumbar Spine Report

The lumbar spine radiograph demonstrates a mild spinal canal stenosis between L1 and L2, with a moderate spinal canal stenosis at L3-L4 and normal or mild narrowing from L4 to S1. Additionally, there is moderate left neural foraminal narrowing at L3-L4, severe narrowing at L5-S1, and moderate left subarticular stenosis between L2 and L3, and L4 and L5. The right neural foraminal spaces from L1-L2 to L5-S1 are mild to moderate in stenosis, with normal to mild left subarticular stenosis. These degenerative changes may correlate with lumbar spine pain and contribute to decreased spinal mobility. Clinically, the patient should be evaluated for potential relief through conservative management or further assessment for surgical indications if symptomatic.

## Concise Lumbar Spine Report:

Issue: Degenerative changes in the lumbar vertebrae with mild to moderate spinal canal and neural foraminal stenosis, particularly at L3-L4 and L5-S1. Moderate left subarticular stenosis between L2-L3 and L4-L5. The radiographic findings may be associated with the patient'
