

# **MRI Lumbar Spine Report**

Certainly! Here's a concise MRI lumbar spine report focusing only on degenerative classification, based on the provided sagittal T2-weighted images:

## **MRI Lumbar Spine Report**

### **Findings:**

**L3-L4:** Moderate disc desiccation is evident. There is mild posterior disc bulging and facet arthropathy. There is moderate right and mild left neural foraminal stenosis.

**L4-L5:** Moderate disc desiccation with mild posterior disc bulging, and facet arthropathy. There is moderate right and mild left neural foraminal stenosis.

**L5-S1:** Severe disc desiccation and loss of disc space height is noted. There is moderate posterior disc bulging and facet arthropathy. There is severe right and moderate left neural foraminal stenosis.

**Other:** No acute vertebral body fracture, retrolisthesis, or significant marrow edema is seen. Conus is normal.

### **Impression:**

Multilevel degenerative disc disease, most prominent at the L5-S1 level, with associated facet arthropathy and neural foraminal stenosis. These findings suggest advanced degeneration at L5-S1 compared to L3-L4 and L4-L5 levels.

**Note:** This report focuses solely on degenerative changes. Any other findings would require separate assessment. Clinical correlation is recommended.
