

MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI demonstrates varying degrees of spinal canal stenosis and neural foraminal narrowing bilaterally.

Spinal Canal Stenosis:

- L1-L2: Normal/Mild
- L2-L3: Moderate
- L3-L4: Severe
- L4-L5: Normal/Mild
- L5-S1: Normal/Mild

Neural Foraminal Narrowing:

- Left:
 - L1-L2: Moderate
 - L2-L3: Moderate
 - L3-L4: Normal/Mild
 - L4-L5: Moderate
 - L5-S1: Moderate
- Right:
 - L1-L2: Normal/Mild
 - L2-L3: Moderate
 - L3-L4: Severe
 - L4-L5: Normal/Mild
 - L5-S1: Normal/Mild

Subarticular Stenosis:

- Left:
 - L1-L2: Moderate
 - L2-L3: Severe
 - L3-L4: Moderate
 - L4-L5: Moderate
 - L5-S1: Moderate
- Right:
 - L1-L2: Moderate
 - L2-L3: Moderate
 - L3-L4: Moderate
 - L4-L5: Moderate
 - L5-S1: Normal/Mild

Overall, there is a progressive severity of spinal canal stenosis from L3-L4 to L2-L3, with the most severe stenosis noted at L3-L4 bilaterally. Neural foraminal narrowing is moderate to severe at the L2-L3 and L3-L4 levels on the left side, and severe at L3-L4 on the right side. Subarticular stenosis is moderate to severe at the L2-L3 and L3-L4 levels on both sides. These findings may correlate with the patient's clinical symptoms and should be correlated with the patient's history and physical examination. Further evaluation and management should be considered.
