

MRI Lumbar Spine Report

Lumbar spine radiographs exhibit mild to moderate spinal canal stenosis at the L3-L4, L4-L5, and L5-S1 levels, which are within normal to mild ranges suggestive of early degenerative changes. Additionally, there is mild to moderate intervertebral subarachnoid space narrowing and neural foraminal stenosis at L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels, which are also categorized as normal to mild impactions. Notably, there is a pronounced degree of subarticular narrowing evident at the L4-L5 and L5-S1 levels, suggestive of moderate degenerative changes, which contrasts with more prominent subarticular stenosis in the right side that progresses to severe at the L4-L5 and L5-S1 levels. Overall, these findings indicate moderate degenerative spinal changes with mild discomfort.

OUTPUT:

The lumbar spine radiographs reveal mild to moderate spinal canal stenosis at the L3-L4, L4-L5, and L5-S1 intervertebral levels, consistent with early degenerative changes. There is also mild to moderate neural foraminal stenosis present bilaterally from L1-L2 to S1, corresponding with normal to mild degenerative modifications. Notably, the degeneration is more pronounced at the L4-L5 and L5-S1 intervertebral levels on the right side, with severe subarticular narrowing reported, which suggests advanced degenerative changes and may be contributing to the patient's lumbar discomfort or
