

MRI Lumbar Spine Report

Okay, here's a concise lumbar spine MRI report focusing solely on degenerative findings based on the provided images:

MRI Lumbar Spine Report

Degenerative Findings:

Multilevel Degenerative Disc Disease: Evidence of disc desiccation and height loss is noted at multiple levels within the lumbar spine. Specifically, decreased T2 signal intensity and varying degrees of disc space narrowing are present.

Endplate changes Modic Type 1 and 2 marrow changes present adjacent to the disc spaces particularly at the lower levels.

Facet Degeneration Facet hypertrophy with mild joint space narrowing noted.

Ligamentum Flavum Hypertrophy: Mild thickening of the ligamentum flavum is observed at multiple levels, potentially contributing to mild spinal canal compromise.

Spinal Stenosis: mild narrowing of the central spinal canal is seen at the levels with degeneration.

Conclusion:

Multilevel degenerative changes of the lumbar spine.

Note: This report is based solely on the images provided and focuses only on degenerative changes. Clinical correlation is recommended for a complete assessment.
