

# MRI Lumbar Spine Report

## MRI Lumbar Spine Report:

The MRI of the lumbar spine demonstrates mild to moderate spinal canal and neural foraminal stenosis at L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels bilaterally, which are within normal/mild range. There is also mild bilateral neural foraminal narrowing at corresponding levels.

The left subarticular stenosis is noted to be mild at L1-L2, L2-L3, L3-L4, and L4-L5 levels, and mild at L5-S1. However, there is a moderate stenosis observed at the L4-L5 level. On the right side, the subarticular stenosis is mild at L1-L2, L2-L3, L3-L4, and L5-S1 levels, with severe stenosis noted at the L4-L5 level.

Overall, the findings suggest mild to moderate lumbar spinal stenosis with a more significant concern at the L4-L5 level on the right side. Clinical correlation and further evaluation are recommended to guide management and treatment options.

## Impression:

Mild to moderate bilateral spinal canal and neural foraminal stenosis at L1-L5 levels. Moderate left subarticular stenosis at L4-L5 level and severe right subarticular stenosis at L4-L5 level. Clinical correlation and further evaluation are recommended.
