

MRI Lumbar Spine Report

Certainly, here's a concise MRI lumbar spine report focusing solely on degenerative changes observed in the provided images:

MRI Lumbar Spine - Degenerative Findings

Intervertebral Disc Desiccation: There is evidence of disc desiccation, seen as reduced signal intensity on T2-weighted images, throughout the visualized lumbar spine, most prominently at the L3-4 and L4-5 levels.

Disc Height Loss: There is disc height loss most notably at the L3-4 and L4-5 levels

Endplate Degeneration: Endplate changes, including irregularities and sclerosis are present, most prominently at the L3-4 and L4-5 levels, likely representing Type 2 Modic changes.

Facet Degeneration: There is facet joint arthropathy noted.

Degenerative Classification:

Mild to moderate multi-level degenerative disc disease with associated endplate and facet changes.

Note: This report is limited to degenerative changes. It doesn't include other potential findings such as disc herniation, neural compression or other potential pathology.
