

MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focusing solely on degenerative changes based on the provided images:

MRI Lumbar Spine Report

Findings:

Disc Degeneration: There is evidence of mild to moderate disc desiccation and height loss at multiple levels within the lumbar spine, most pronounced at L4-L5 and L5-S1.

Facet Joint Degeneration: Mild to moderate facet joint arthrosis is noted, primarily at the L4-L5 and L5-S1 levels.

Spinal Canal: There are moderate changes that appear to be related to ligamentum flavum hypertrophy and facet joint overgrowth causing mild spinal canal stenosis at the L4-L5 and L5-S1 levels.

Impression:

Multilevel degenerative changes are present throughout the lumbar spine, predominantly involving the L4-L5 and L5-S1 levels. Degenerative disc disease with disc space narrowing, facet arthrosis, and associated hypertrophy appear to contribute to moderate spinal canal stenosis in the central canal at the L4-L5 and L5-S1 levels.
