

MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI findings demonstrate mild to moderate spinal canal stenosis and neural foraminal narrowing bilaterally at the L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels. The left neural foraminal narrowing at these levels is mild, while the right neural foraminal narrowing is moderate.

Additionally, there is moderate left subarticular stenosis at the L3-L4 and L5-S1 levels, and severe stenosis at the L4-L5 level. The right subarticular stenosis is mild at the L2-L3 and L4-L5 levels, with normal/mild stenosis at the L1-L2 and L5-S1 levels.

In summary, the patient presents with mild to moderate spinal canal stenosis and neural foraminal narrowing at multiple levels, with more significant stenosis observed in the left subarticular region at the L3-L4 and L5-S1 levels. Further evaluation and management may be necessary to address these findings and alleviate any associated symptoms.
