

# MRI Lumbar Spine Report

Okay, here's a concise MRI lumbar spine report focusing solely on degenerative findings, based on the provided sagittal T2-weighted images:

## MRI Lumbar Spine Report - Degenerative Findings

### Findings:

**Disc Desiccation/Degeneration:** Multilevel disc desiccation and signal loss are noted, most pronounced at L4-L5 and L5-S1. There is decreased disc height at these levels.

**Bulging:** There is evidence of disc bulging at L4-L5 and L5-S1.

**Facet Arthropathy:** Moderate facet arthropathy is present at multiple levels within the lumbar spine.

**Ligamentum Flavum Hypertrophy:** Mild to moderate ligamentum flavum hypertrophy is observed, most notable at L4-L5 and L5-S1.

**Bone Marrow Edema:** There is mild bone marrow edema of the inferior endplate of L4.

### Impression:

Multilevel degenerative changes of the lumbar spine are present including disc desiccation, disc bulging, facet arthropathy, ligamentum flavum hypertrophy and bone marrow edema. The most significant changes are seen at L4-L5 and L5-S1.

**Note:** This report is limited to degenerative findings based solely on the sagittal T2 images. A complete interpretation would require reviewing all available sequences and other imaging.
