

MRI Lumbar Spine Report

Certainly! Based on the provided sagittal T2-weighted MRI lumbar spine images, here's a concise report focusing solely on degenerative findings:

MRI Lumbar Spine Report - Degenerative Findings

Findings:

Disc Desiccation: Evidence of disc desiccation is noted throughout the lumbar spine, with varying degrees of signal loss in the intervertebral discs.

Disc Height Loss: Mild disc height loss is observed, particularly at the lower lumbar levels.

Endplate Changes: There are minor changes at the endplates of multiple vertebrae.

Facet Arthropathy: There is mild facet arthropathy noted throughout the lumbar spine.

No significant central canal or neural foraminal stenosis is apparent.

Impression:

Mild lumbar spondylosis.
