

MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focusing solely on degenerative classifications based on the provided images:

MRI LUMBAR SPINE REPORT

FINDINGS:

Degenerative Changes:

Mild to moderate disc desiccation is noted at multiple levels, with the most significant desiccation visualized at L4-L5 and L5-S1.

There are mild disc bulges and osteophyte formation present.

Modic type 1 and type 2 endplate changes are noted.

IMPRESSION:

Findings are consistent with mild to moderate multilevel degenerative disc disease of the lumbar spine with associated mild disc bulging, endplate change and osteophyte formation.

Note: This report is focused exclusively on degenerative findings. Other potential findings (e.g., neoplastic, infectious, traumatic, or inflammatory signal changes, pathology) are not included. This report does not make any clinical recommendations. The patient should have a clinical examination for full correlation.
