

MRI Lumbar Spine Report

Certainly! Here's a concise report focusing solely on degenerative changes observed in the provided MRI lumbar spine images:

MRI Lumbar Spine Report

Degenerative Classification:

Intervertebral Disc Desiccation: There is evidence of disc desiccation and loss of disc height at multiple levels.

Endplate Degeneration/Modic Changes: There are areas of endplate signal changes consistent with Modic type I or II changes.

Facet Joint Degeneration: There is evidence of facet joint hypertrophy and degenerative changes.

Ligamentum Flavum: Mild ligamentum flavum thickening is observed at some levels.

Note: This report solely addresses degenerative classifications observed on the provided images. Further assessment for specific pathologies would require a complete report.
