

MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI lumbar spine demonstrates mild to moderate spinal canal stenosis and foraminal narrowing at L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels bilaterally, which are within normal/mild limits. There is no evidence of severe stenosis or significant foraminal narrowing at these levels.

Notably, there is severe left subarticular stenosis at L4-L5 and moderate stenosis at L3-L4. The right side shows mild stenosis at L2-L3 and severe stenosis at L4-L5.

In summary, the patient presents with mild to moderate spinal canal stenosis and foraminal narrowing at multiple levels, with more pronounced stenosis on the left side at L4-L5 and L3-L4. The right side shows moderate stenosis at L3-L4 and severe stenosis at L4-L5. Clinical correlation and further evaluation are recommended to guide management.
