

MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI lumbar spine demonstrates mild to moderate spinal canal stenosis at L4-L5 bilaterally, with the left side showing a moderate degree of stenosis. Neural foraminal narrowing is noted to be mild at all levels (L1-L5) on both the left and right sides.

The left subarticular region exhibits mild stenosis at L1-L2, L2-L3, L3-L4, and L5-S1 levels.

However, there is a significant finding of severe stenosis at the L4-L5 level. The right subarticular region shows mild stenosis at L1-L2, L2-L3, L3-L4, and L5-S1 levels with moderate stenosis at the L4-L5 level.

In summary, the patient has mild to moderate spinal canal stenosis at L4-L5 and mild neural foraminal narrowing at all levels. The most concerning finding is the severe subarticular stenosis at L4-L5 on the left side. These findings may correlate with the patient's symptoms and should be correlated with clinical findings for appropriate management. Further evaluation and treatment planning are recommended.
