

# MRI Lumbar Spine Report

Okay, here's a concise MRI lumbar spine report focusing **\*\*only\*\*** on degenerative classification based on the provided images:

## MRI Lumbar Spine Report - Degenerative Classification

### Findings:

**Disc Desiccation:** There is evidence of disc desiccation (loss of hydration) at multiple levels throughout the lumbar spine.

**Disc Height Loss:** Mild to moderate loss of disc height is noted at multiple levels of the lumbar spine.

**Endplate Degeneration:** Modic type 1 endplate changes are identified primarily at the L4/L5 level.

**Facet Arthropathy:** Facet joint degenerative changes with mild to moderate osteoarthrosis are present throughout the lumbar spine.

**Spinal Canal Stenosis:** Mild to moderate narrowing of the spinal canal is observed at L3/L4 and L4/L5 due to a combination of disc bulging and facet arthropathy.

**Neuroforaminal Stenosis:** Mild to moderate neuroforaminal narrowing is present at L3/L4 and L4/L5.

**Ligamentum Flavum Hypertrophy:** Mild ligamentum flavum hypertrophy is noted.

### Summary:

The images reveal multilevel degenerative changes including disc desiccation, height loss, endplate degeneration, facet arthropathy, spinal canal and neuroforaminal stenosis. These findings are consistent with spondylosis.

**Note:** This report is based only on the degenerative classification, and does not comment on other pathology that may or may not be present on these images. A full report should include all observations from the full study and be interpreted by a radiologist or qualified physician.
