

MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focusing solely on degenerative changes, based on the provided images:

MRI Lumbar Spine Report - Degenerative Changes

Findings:

Disc Desiccation: There is evidence of decreased signal intensity within the intervertebral discs at multiple levels, particularly at the L4-L5 and L5-S1 levels, suggestive of disc desiccation. This is indicative of degenerative disc disease.

Disc Bulging/Protrusion: Mild posterior disc bulging or protrusion is noted at the L4-L5 and L5-S1 levels. There is evidence of mild impingement on the thecal sac

Facet Arthropathy: Mild degenerative changes are seen in the facet joints at multiple levels.

Impression:

The primary findings demonstrate evidence of mild multi-level degenerative disc disease and mild facet arthropathy.
