

MRI Lumbar Spine Report

Okay, here's a concise MRI lumbar spine report focusing solely on degenerative findings, based on the provided images:

MRI Lumbar Spine Report (Degenerative Findings Only)

Findings:

Vertebral Bodies: There is evidence of mild disc space narrowing noted throughout the lumbar spine, with slight loss of anterior vertebral body height.

Intervertebral Discs: There is evidence of mild intervertebral disc desiccation and mild disc bulging most prominently at the L3-L4 and L4-L5 levels. There is evidence of osteophyte formation involving the margins of the intervertebral disc spaces.

Neural Foramina: Mild narrowing of the neural foramina at the L3-L4 and L4-L5 levels is noted due to disc bulges and osteophyte formation.

Spinal Canal: No significant central canal stenosis noted.

Impression:

Mild multi-level degenerative changes of the lumbar spine, including disc desiccation, disc bulging, disc space narrowing, and mild neural foraminal narrowing.

Note:

This report is limited to degenerative findings and does not address other potential pathology.

A full clinical correlation should always be considered.

This report is based on the provided images alone and further imaging or clinical information may change this impression.
