

# MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focusing solely on degenerative changes:

## MRI Lumbar Spine Report - Degenerative Findings

### Findings:

**Multilevel Degenerative Disc Disease:** There is evidence of degenerative disc disease throughout the visualized lumbar spine, characterized by loss of disc height and desiccation (loss of hydration/signal) on multiple levels.

**Endplate Degeneration/Sclerosis:** Mild endplate degenerative changes and sclerosis are noted at multiple vertebral levels.

**Facet Arthropathy:** Mild degenerative changes, including facet joint hypertrophy, is noted bilaterally at multiple levels.

**Spinal Stenosis:** Mild spinal canal narrowing is noted at L3-L4 through L5-S1 due to the combined effect of disc bulge and facet hypertrophy

**No evidence of spondylolisthesis**

### Impression:

Mild multi level degenerative changes are seen with mild narrowing of the spinal canal at multiple levels.

**Note:** \*This report focuses solely on degenerative findings. Additional findings, such as root compression or other pathologies, might be present but are excluded from this report.
