

# **MRI Lumbar Spine Report**

Certainly, here's a concise MRI lumbar spine report focusing solely on degenerative classification based on the provided images:

## **MRI Lumbar Spine Report - Degenerative Findings**

### **Findings:**

**Disc Degeneration:** There is evidence of disc degeneration throughout the lumbar spine, most prominently at the L4-L5 and L5-S1 levels. This is demonstrated by signal loss within the intervertebral discs and some loss of disc height.

**Facet Degeneration:** Mild facet joint degenerative changes are present, with evidence of early osteoarthritis, particularly noted at L4-L5 and L5-S1 levels.

**No Evidence of Stenosis:** There is no significant evidence of spinal canal stenosis or foraminal stenosis at any level.

### **Classification:**

Mild to moderate degenerative changes affecting the intervertebral discs and facet joints, most prominent at L4-L5 and L5-S1 levels.

### **Conclusion:**

Mild to moderate degenerative changes are observed, in keeping with early and progressive wear and tear. The most significant changes are at L4-L5 and L5-S1.

### **Disclaimer:**

This report is based solely on the provided images and focuses on degenerative classifications. It should not be used for diagnosis and treatment recommendations. Please consult with a qualified healthcare professional for further evaluation and management.
