

MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI findings demonstrate mild to moderate spinal canal stenosis and neural foraminal narrowing bilaterally. The stenosis is mild at L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels on both sides. Neural foraminal narrowing is mild at L1-L2, L2-L3, L4-L5, and L5-S1 levels on the left, and mild at L1-L2 on the right.

The left side shows moderate neural foraminal narrowing at L3-L4 and L5-S1 levels, while the right side exhibits severe narrowing at L3-L4 and L4-L5 levels.

Subarticular stenosis is noted as mild at L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels on the left, and mild at L1-L2 on the right. The right side demonstrates moderate stenosis at L3-L4, L4-L5, and L5-S1 levels.

Overall, the patient presents with mild to moderate spinal canal stenosis and neural foraminal narrowing, with more severe involvement on the right side. The subarticular stenosis is also more pronounced on the right side. Clinical correlation and further evaluation are recommended to determine the appropriate management plan.
