

MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focused solely on degenerative findings:

MRI Lumbar Spine Report (Degenerative Classification Only)

Technique: Sagittal T1 and T2 weighted sequences of the lumbar spine.

Findings:

Disc Desiccation/Degeneration: There is evidence of disc desiccation and degenerative changes at multiple lumbar levels. Specifically, disc signal intensity is decreased, consistent with dehydration.

Disc Bulging/Protrusion: Mild disc bulging or protrusion is noted at multiple levels but no obvious central canal stenosis or impingement on thecal sac/ nerve roots.

Facet Joint Degeneration: Mild facet joint degenerative changes are evident at multiple levels, characterized by joint space narrowing or mild arthropathy changes.

Spondylosis/Osteophytes: Mild spondylosis and osteophyte formation is observed at multiple levels, consistent with degenerative changes.

Impression:

Multilevel degenerative changes of the lumbar spine, including disc desiccation, bulging/protrusion, facet joint arthropathy and mild spondylosis.

Note: This report is limited to degenerative findings only. Other potential abnormalities may be present and should be evaluated in context with the full clinical picture. A complete report including more comprehensive detail should be made by the interpreting radiologist.
