

MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI lumbar spine demonstrates mild to moderate spinal canal stenosis and foraminal narrowing bilaterally between L1-L2 and L3-L4 levels. The stenosis is severe at the L4-L5 level. Neural foraminal narrowing is mild at L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels on both sides. Moderate narrowing is observed at the L3-L4 level bilaterally.

Subarticular stenosis is mild at L1-L2 and L2-L3 levels on both sides. Moderate stenosis is noted at the L3-L4 level bilaterally. Severe stenosis is present at the L4-L5 level on both sides. Mild stenosis is seen at the L5-S1 level on both sides.

Overall, the findings suggest mild to moderate spinal canal and foraminal stenosis, with severe subarticular stenosis at the L4-L5 level. Clinical correlation is recommended for appropriate management.
