

MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI lumbar spine demonstrates mild to moderate spinal canal and neural foraminal stenosis bilaterally. The stenosis is noted at the L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels on both the left and right sides, with the left side showing mild narrowing and the right side exhibiting moderate narrowing at the L4-L5 level.

Additionally, mild neural foraminal narrowing is present at the L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels on both sides, with the right side showing severe narrowing at the L4-L5 level.

Subarticular stenosis is also observed, with mild narrowing at the L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels on both sides. The right side demonstrates moderate stenosis at the L4-L5 level and severe stenosis at the L5-S1 level.

Overall, the findings suggest mild to moderate spinal canal and neural foraminal stenosis, with more pronounced narrowing on the right side, particularly at the L4-L5 and L5-S1 levels. Further evaluation and management may be necessary to address the right side's more severe stenosis.

Impression:

Mild to moderate bilateral spinal canal and neural foraminal stenosis, with more pronounced narrowing on the right side at the L4-L5 and L5-S1 levels. Moderate subarticular stenosis on the right side at the L4-L5 level and severe stenosis at the L5-S1 level. Clinical correlation and further evaluation recommended.
