

MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focusing solely on degenerative classifications based on the provided images:

MRI Lumbar Spine Report (Degenerative Changes)

Findings:

Disc Desiccation: Moderate to severe disc desiccation is noted throughout the lumbar spine, most prominent at L4-L5 and L5-S1 levels, consistent with degenerative disc disease.

Disc Height Loss: Mild disc space narrowing is observed at multiple levels with the most pronounced reduction at L4-L5 and L5-S1.

Endplate Degeneration: Mild endplate sclerosis and degenerative changes are present at multiple levels, with focal changes of type 1 marrow edema, most apparent at L5-S1.

Facet Joint Degeneration: Mild to moderate facet joint arthropathy is present at multiple levels, with the most significant changes at L4-L5 and L5-S1.

Ligamentum Flavum: No significant ligamentum flavum hypertrophy is present.

Impression:

Multilevel degenerative changes are noted throughout the lumbar spine, most prominent at L4-L5 and L5-S1, including disc desiccation, disc height loss, endplate changes, and facet joint arthropathy. These findings are consistent with degenerative disc disease and spondylosis.

Note: This report is solely focused on degenerative findings. If clinical history and a needed, please request.

Please let me know if you have any further requests.
