

MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI findings indicate mild to moderate neural foraminal narrowing and subarticular stenosis at the L4-L5 and L5-S1 levels on both sides. The left side shows moderate to severe foraminal narrowing at L5-S1, while the right side presents moderate foraminal narrowing at L4-L5. Subarticular stenosis is mild at all levels on both sides, with moderate stenosis noted at L4-L5 and L5-S1 on the right side. Overall, the spinal canal stenosis is mild at all levels. No significant neural compromise is suggested by these findings. Clinical correlation is recommended.

Impression:

1. Mild to moderate left neural foraminal narrowing at L5-S1
2. Moderate left and right neural foraminal narrowing at L4-L5
3. Mild subarticular stenosis at all levels bilaterally
4. No significant spinal canal stenosis

Recommendation: Clinical correlation and further evaluation as needed.
