

MRI Lumbar Spine Report

Okay, here's a concise MRI lumbar spine report focused solely on degenerative findings, based on the provided images:

MRI Lumbar Spine Report - Degenerative Findings

Findings:

1. ****Disc Desiccation and Height Loss:**** There is evidence of disc desiccation and reduced disc height throughout the lumbar spine, most pronounced at the L4-L5 and L5-S1 levels.
2. ****Facet Joint Arthropathy:**** Mild facet joint hypertrophy and degenerative changes are present at multiple levels, particularly in the lower lumbar spine.
3. ****Ligamentum Flavum Hypertrophy:**** Mild thickening of the ligamentum flavum is noted, contributing to the thecal sac narrowing at L4-L5 and L5-S1.
4. ****Spinal Canal Stenosis:**** Mild central canal stenosis is present, notably at L4-L5 and L5-S1 secondary to disc bulging, facet and ligamentous hypertrophy
5. ****Disc Bulging:**** There is evidence of broad-based disc bulging at L4-L5 and L5-S1.

Impression:

Degenerative changes affecting the lumbar spine, including disc desiccation, facet arthropathy, ligamentum flavum hypertrophy and disc bulging and resultant mild central spinal stenosis at L4-L5 and L5-S1 levels.

Note: This report focuses solely on degenerative changes and does not include any potential abnormalities.
