

MRI Lumbar Spine Report

The lumbar spine examination reveals mild spinal canal stenosis at the L1-L2, L2-L3, and L3-L4 levels, which are within normal limits but should be monitored. Further, moderate narrowing of the neural foramina is detected at the L4-L5 and L5-S1 levels on the left, possibly contributing to nerve root compression, while mild foraminal narrowing is observed at the L1-L2, L2-L3, L3-L4, and L5-S1 levels bilaterally. Additionally, severe subarachnoid space stenosis at the L4-L5 and L5-S1 levels on the left, along with mild stenosis in these levels, and moderate on the right, may also be suggestive of nerve root impingement. Overall, the spinal alignment remains generally maintained with no evident significant vertebral alignment disruption. However, the detected changes, particularly at the L4-L5 and L5-S1 levels, are consistent with degenerative changes that may be impacting the left lumbar spine and should be addressed in clinical correlation with the patient's symptoms.

Reviewed films are within normal limits for degenerative changes.

Radiates to the lower extremities.

Please note that this report does not include any specific clinical symptoms or patient history.

Further correlation with the patient's clinical presentation is recommended.
