

MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focusing solely on degenerative classifications based on the provided images:

MRI Lumbar Spine Report (Degenerative Classification)

Findings:

Disc Desiccation: Moderate to severe disc desiccation is present at all visualized levels.

Disc Height Loss: There is mild to moderate disc height loss at multiple levels.

Endplate Changes: There is mild to moderate Modic type 1 and 2 endplate changes at several levels, particularly L4-L5 and L5-S1.

Facet Arthropathy: Mild facet joint arthropathy and hypertrophy are seen at multiple levels.

Spinal Canal Stenosis: There is mild to moderate spinal canal narrowing, particularly at the L4-L5 and L5-S1 levels.

Neural Foraminal Stenosis: Mild neural foraminal stenosis at multiple levels, most notably L4-L5 and L5-S1.

Impression:

The lumbar spine demonstrates multi-level degenerative changes, including disc desiccation, disc height loss, Modic endplate changes, facet arthropathy, and mild to moderate spinal canal and neural foraminal stenosis.

Note: This report solely addresses degenerative findings. It does not include assessment of other potential abnormalities. If a full report is needed please include additional requirements.
