

MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focusing solely on degenerative findings, based on the provided images:

MRI Lumbar Spine - Degenerative Classification

Findings:

Multilevel Degenerative Disc Disease: There is evidence of degenerative disc disease involving multiple levels of the lumbar spine. This is characterized by reduced disc height and signal intensity changes on MRI.

Facet Arthropathy: There is facet arthropathy, evidenced by degenerative changes at the facet joints.

Ligamentum Flavum Thickening: Mild thickening of the ligamentum flavum is identified, particularly at the mid-lower lumbar levels.

Impression:

The imaging demonstrates multilevel degenerative changes of the lumbar spine, including disc disease, facet arthropathy, and mild ligamentum flavum thickening. These findings are consistent with degenerative processes of the lumbar spine.

Disclaimer:

This report is based solely on the provided images and focuses exclusively on degenerative findings. It does not address other potential pathologies. A comprehensive interpretation should be done by a qualified radiologist and correlated with clinical findings.
