

MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI lumbar spine demonstrates mild to moderate spinal canal stenosis and foraminal narrowing bilaterally between L1-L5 and S1. The stenosis is most pronounced at L4-L5 and L5-S1 levels, with severe stenosis noted in the left L4-L5 and right L4-L5 interspaces.

Neural foraminal narrowing is mild in the L1-L2, L2-L3, and L3-L4 interspaces on both sides, with moderate narrowing observed in the left L4-L5 and right L4-L5 interspaces.

Subarticular stenosis is mild in the L1-L2, L2-L3, and L3-L4 interspaces bilaterally, with severe stenosis present in the left L4-L5 and right L4-L5 interspaces. The right L5-S1 interspace shows moderate stenosis.

Overall, the findings suggest mild to moderate degenerative changes in the lumbar spine, with more significant pathology at the L4-L5 and L5-S1 levels. Clinical correlation and further evaluation are recommended to guide management.
