

MRI Lumbar Spine Report

Certainly, here is a concise lumbar spine MRI report focusing solely on degenerative findings, based on the provided sagittal images:

MRI LUMBAR SPINE REPORT - Degenerative Classification

Study: Sagittal T2-weighted MRI of the lumbar spine.

Findings:

Disc Desiccation/Degeneration: Evidence of disc desiccation and degenerative changes are noted throughout the lumbar spine, most pronounced at the L5-S1 level.

Disc Height Loss: Mild disc height loss is present at multiple levels, most noticeably at L5-S1.

Endplate Changes: Modic type 1 endplate changes are seen at the L5-S1 endplates.

Facet Arthropathy: Mild degenerative changes are visible in the facet joints of the lumbar spine, with mild facet hypertrophy.

Summary:

The lumbar spine shows findings consistent with moderate multilevel degenerative disc disease, most severe at L5-S1, with associated endplate changes, and facet arthropathy.
