

MRI Lumbar Spine Report

Certainly! Here's a concise MRI lumbar spine report focused solely on degenerative findings, based on the provided sagittal images:

MRI LUMBAR SPINE REPORT

Degenerative Classification

Findings:

Multilevel Degenerative Disc Disease: There is evidence of multilevel degenerative disc disease. This is characterized by decreased disc signal intensity and height, most notable at L4-L5, L5-S1 disc spaces.

Facet Arthropathy: There is mild to moderate facet arthropathy (degenerative changes in the facet joints) present, particularly in the lower lumbar spine.

Spondylosis: There is evidence of spondylosis with mild osteophyte formation at multiple levels

Impression:

Multilevel degenerative changes of the lumbar spine are present, with features of disc desiccation, facet arthropathy, and spondylosis.

Note: This report focuses exclusively on degenerative changes as requested. It does not address other potential findings (e.g. spinal stenosis, disc herniation, etc.) that may be present on a full exam. A full review of all sequences would be needed for a comprehensive report.
