MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI lumbar spine demonstrates mild to moderate spinal canal stenosis and foraminal narrowing bilaterally at L1-L2, L2-L3, L3-L4, and L4-L5 levels, with no significant stenosis at L5-S1. There is moderate subarticular stenosis noted at L3-L4 and L4-L5 levels on the left side, and severe subarticular stenosis at L4-L5 and L5-S1 on the right side.

Overall, the findings suggest mild to moderate spinal canal stenosis and foraminal narrowing, with more severe subarticular stenosis on the right side. Clinical correlation and further evaluation are recommended to guide management and treatment options. Impression:

- 1. Mild to moderate bilateral spinal canal stenosis at L1-L2, L2-L3, L3-L4, and L4-L5 levels
- 2. Mild bilateral foraminal narrowing at L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels
- 3. Moderate subarticular stenosis at L3-L4 and L4-L5 on the left side
- 4. Severe subarticular stenosis at L4-L5 and L5-S1 on the right side Recommendations:
- Clinical correlation with patient symptoms
- Consideration of conservative management or further evaluation for potential surgical intervention, especially for the severe subarticular stenosis on the right side
- Follow-up imaging or consultation with a specialist as needed.
