## **MRI Lumbar Spine Report**

## MRI Lumbar Spine Report:

The MRI of the lumbar spine demonstrates mild to moderate spinal canal stenosis and foraminal narrowing bilaterally between L1-L5 and S1. The stenosis is mild in the L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 regions, while the L4-L5 and L5-S1 regions show moderate stenosis on the left side.

Neural foraminal narrowing is observed in a moderate degree at the L1-L2 level on the left side, with mild to mild narrowing in the remaining levels (L2-L3, L3-L4, L4-L5, L5-S1) bilaterally. Subarticular stenosis is noted to be mild in the L1-L2, L2-L3, L3-L4, and L5-S1 regions on both sides, with moderate stenosis in the L4-L5 region on the left side and severe stenosis in the L4-L5 and L5-S1 regions on the right side.

In summary, the patient presents with mild to moderate spinal canal stenosis and foraminal narrowing, with more significant subarticular stenosis on the right side, particularly in the L4-L5 and L5-S1 regions. These findings may correlate with the patient's clinical symptoms and should be correlated with the patient's history and physical examination for appropriate management. Further evaluation and treatment planning should be considered in consultation with a spine specialist.
