MRI Lumbar Spine Report

MRI Lumbar Spine Report:

The MRI lumbar spine demonstrates mild to moderate spinal canal stenosis and foraminal narrowing at the L1-L2, L2-L3, L3-L4, and L4-L5 levels bilaterally, with no significant stenosis noted at L5-S1. There is a notable progression to moderate stenosis at the L3-L4 and L4-L5 levels, and severe stenosis at the L4-L5 level bilaterally.

Additionally, severe left neural foraminal narrowing is observed at the L5-S1 level, while the right side shows mild to moderate foraminal narrowing at the L1-L2, L2-L3, L3-L4, L4-L5, and L5-S1 levels.

Subarticular stenosis is present at the L1-L2, L2-L3, L3-L4, and L4-L5 levels bilaterally, with moderate stenosis at the L3-L4 and L4-L5 levels, and severe stenosis at the L4-L5 level on the right side.

In summary, the MRI findings indicate mild to moderate spinal canal stenosis and foraminal narrowing at multiple levels, with more severe stenosis and foraminal narrowing at the L4-L5 level bilaterally. Subarticular stenosis is also present, with varying degrees of severity. Clinical correlation and further evaluation are recommended to guide management and treatment planning.
